

How to change your screen resolution

Changing your screen resolution is a very simple process. The following tutorial is for the Windows XP operating system. The process is basically the same for all other versions of Windows.

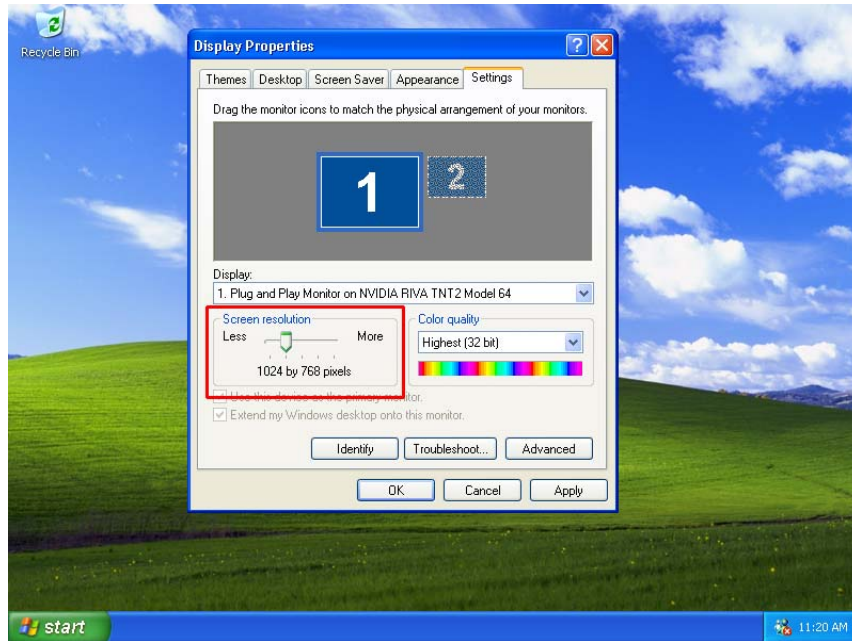

To get started go to your desktop. This is what you see when your computer first starts up. On the desktop, click the right mouse button once. A Windows dialog box appears – on the bottom of this box you'll see “**Properties**” as shown in the picture below:

Select the “**Properties**” option and you will be presented with the Windows Properties dialog box as shown in the image below. Select the “**Settings**” tab to find the screen resolution control.

The area inside the red rectangle is the screen resolution control. To change this to 1024 x 768, simply drag the control 1 notch to the right. As you can see in the picture below, the control now shows 1024 by 768 and the notch is 1 to the right.

The final step is to click the “OK” button on the bottom of the dialog box and your computer will be set at the required resolution: 1024 by 768.
